

# Distribution box time-delay circuit breaker

## Overview

This optional, externally mounted, module has an adjustable time delay of one to three seconds. The device can be implemented to prevent un-desired Breaker 'tripping' due to momentary voltage outages (50% of rated Voltage) and is connected in series with the under voltage release. The  $I_{sd}$  and  $t_{sd}$  settings help to ensure that the short-time withstand current of protected equipment is not exceeded. When short-time overcurrent protection automatically disconnects the power supply in accordance with IEC 60364-4-41, the  $I_{sd}$  setting must take into consideration the fault loop. The circuit breaker is designed to attain a predetermined value of limiting non-actuating time corresponding to a given value of residual current. Our time-delay CBR operates within 0. May. This is an accessory for PowerPact M and P-Frame circuit breakers. This product complies with UL and CSA standards. Review the three curves on this page and the next page.
