

# Fiber Bragg Grating Temperature Strain Sensor

## Overview

The Fiber Bragg Grating (FBG) provides accurate readings of temperature, strain (both dynamic and static), vibration, pressure, and acceleration over a wide range (-20°C - 900°C). Fiber optic monitoring systems consist of an integrator, a fiber optic sensor, engineering methods, and software. The temperature-dependent change of the refractive indices of the fiber, consequently the shift of its Bragg wavelength, is used as a measure of the temperature. Their unique attributes—compactness, immunity to electromagnetic interference, and multiplexing capabilities—make them a compelling choice for industries ranging from. Fiber Bragg Grating (FBG) technology is one of the most popular choices for optical fiber sensors for strain or temperature measurements due to their simple manufacture, as we will see later on, and due to the relatively strong reflected signal. It should be noted that temperature and strain sensitivities must be considered, when high performance of the optimal sensor is required.
