

Glass Sintered Fiber Optic Connectors

Overview

Most optical fiber connectors are spring-loaded, so the fiber faces are pressed together when the connectors are mated. The resulting glass-to-glass or plastic-to-plastic contact eliminates signal losses that would be caused by an air gap between the joined fibers.

An optical fiber connector is a device used to link, facilitating the efficient transmission of light signals. Optical fiber connectors are used to join optical fibers where a connect/disconnect capability is required. Due to the and tuning procedures that may be incorporated into optical connector manufacturing. Many types of optical connector have been developed at different times, and for different purposes. Many of them are summarized in the tables below. Modern connectors typically use a physical contact polisher. Features of good connector design:

- Low insertion loss - should not exceed 0.75
- Typical insertion repeatability, the difference in insertion loss between one plugging and another, is 0.2 dB.
