

# High humidity in network cabinet

## Overview

Monitor humidity and temperature to prevent condensation in telecom cabinets. Choose cabinets with high IP or NEMA ratings for better protection. Regular maintenance and monitoring help catch problems early. Typical scenarios include: Ports, offshore platforms, and coastal. According to the American Society of Heating, Refrigeration, and Air-Conditioning Engineers (ASHRAE), server rooms should be kept at 59 degrees F to 89. However, many experts suggest a range of 64. Even during the summer we don't go much above 30-35% humidity. I've read that ideally, humidity levels can be anywhere between about 35% and 70%. It appears almost all network switches I come across now has at least an operating temperature range of 0 to 40 degrees and humidity range between 15%. If your network touches any of the following, humidity is already part of your system design—whether you planned for it or not: Even inside cabinets, humid air exposure is continuous and cumulative.
