

How to place cable heads in vertical cable trays

Overview

Whether using a wire mesh basket or electrical cable tray, both can be mounted using the correct brackets, hangers, or riser supports. Best practices include: Splice connectors to maintain structural integrity. Remember that cables may be flexible, but your support structure. As a key support system for cable laying in building electrical engineering, the installation quality of vertical cable trays directly affects the safe operation of power, communication, and other circuits. For all of these configurations, it is important to pay close attention to how the cables. Cable trays are available in different configurations, straight sections are available to route cables in a horizontal or vertical plane. A rung spacing of 6 to 9 inches (150 to 230 mm) is preferable when the cable tray cont d for instrumentation and control applications that require. When offloading tray from a flat deck trailer using an overhead crane, care should be exercised in the placement and length of the slings to prevent crushing the product (siderails).
