

Operation mode of relay protection device

Overview

A protective relay is an automatic device that detects abnormalities in an electrical circuit and closes its contacts. This action completes the circuit breaker's trip coil circuit, causing the breaker to trip and disconnect the faulty section from the healthy circuit. Also principles of various protective relays and schemes including special protection. A protective relay is an intelligent electrical device designed to detect faults in power systems and initiate corrective actions such as tripping a circuit breaker. Its main purpose is to safeguard electrical equipment like transformers, generators, and transmission lines from damage due to. Combines protection, sensors, control power, and circuit breaker in a single package Typically added to a breaker close circuit to prevent accidental reclosure after a trip. Three fundamental components required for each circuit breaker. In other words, the prime function of protective relays is the timely and.
