

Optical Module OLT and ONU

Overview

The orchestration of OLT (Optical Line Terminal) and ONU (Optical Network Unit) optical modules in networking is fundamental to the efficient and reliable operation of fiber-optic communication systems. PON has attracted much attention in recent years due to its low cost and high performance. Essentially, the OLT is the brains of the FTTH network, controlling how. PON (passive optical network) is a fiber-optic network that employs a point-to-multipoint topology and fiber optic splitters to transmit data from a single source to multiple user endpoints. In contrast to AON, multiple customers are connected to a single transceiver by means of. There are two important types of systems that make FTTH broadband connections possible. These are active optical networks (AON) and passive optical networks (PON). By far the majority of FTTH deployments in planning and in deployment use a PON in order to save on fiber costs.
