For Internet Service Providers (ISPs) and network operators, the Fiber-to-the-Home (FTTH) race is a race for reliability. While backbone and distribution networks get the most attention during planning, the success of the entire architecture rests on the most fragile link: the fiber optic drop. In any FTTH (Fiber to the Home) network, the drop cable is the final and most critical part of the optical access network. Fiber optic cable is designed to transmit data using light signals instead of electricity, making it faster, more secure, and immune to electromagnetic interference compared to traditional copper cables.
