

Reasons for grounding of the distribution box

Overview

The grounding system provides a low-impedance path for fault current and limits the voltage rise on the normally non-current-carrying metallic components of the electrical distribution system. This helps to reduce the potential difference that exists between conductive parts and the earth. Equipment Protection: Grounding protects substation. Think of it this way: That distribution box in your facility?

It's not just a metal container – it's the quarterback coordinating all electrical flows. If its grounding fails, every connected device becomes vulnerable. Each DISTRIBUTION BOX and controller must be grounded. 26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used. During fault conditions, low impedance results in high fault current flow, causing overcurrent protective. This guide covers everything you need to know about safe grounding in industrial plants, including key threats, terminologies, and grounding systems. Why Grounding Is Essential Grounding is vital for two primary reasons: Personal Safety: Proper grounding ensures faults are quickly cleared by.
