

The Core of the Control System in a Switch

Overview

The PLC is the brain of the panel. It reads data from sensors, runs programmed logic, and sends out commands to other components like motors or lights. It's the key to making your system automated and intelligent. A Network Switch is one of the essential devices for building modern networks, capable of enhancing network performance and reliability, providing stable and efficient data transmission services for various network applications. These networks are designed with three tiers that facilitate strategic installation, management, and maintenance, and so on. The strategic design of a hierarchy network may comprise more than three layers. A core switch is the backbone of a large-scale network, designed to handle massive volumes of traffic with ultra-low latency and maximum reliability. (For next-generation data center layouts, see our guide on Spine-Leaf Architecture vs. Traditional 3-Tier Network Design).
