

# Why is there a fiber optic cable underneath

## Overview

Most people assume the internet operates through satellites, but in reality, 99% of global internet traffic travels through undersea fiber optic cables. This hidden infrastructure, a web of more than 1.3 million kilometres of fibre optic lines, is the true backbone of. A fiber optic cable is a thin strand of glass or plastic that transmits data as pulses of light instead of electrical signals. Where traditional copper cables max out at about 10 gigabits per second, fiber optic cables can handle 100 gigabits per second with commercially available hardware, and. Modern submarine cables use fiber-optic technology. These glass fibers are wrapped in layers of plastic (and sometimes steel wire) for protection. How thick are undersea cables?

For. Subsea cables serve as critical infrastructure in global power transmission and communications networks, connecting isolated communities to the outside world. Unlike. Today, there are more than 500 active submarine cables crisscrossing the world's oceans, stretching over 1. They connect major cities and data hubs such as New York and London, Lagos and Lisbon, Singapore and Los Angeles.
